Charcoal Rot caused by *Macrophomina phaseolina*

* Similar to symptoms caused by *Colletotrichum* and *Phytophthora*

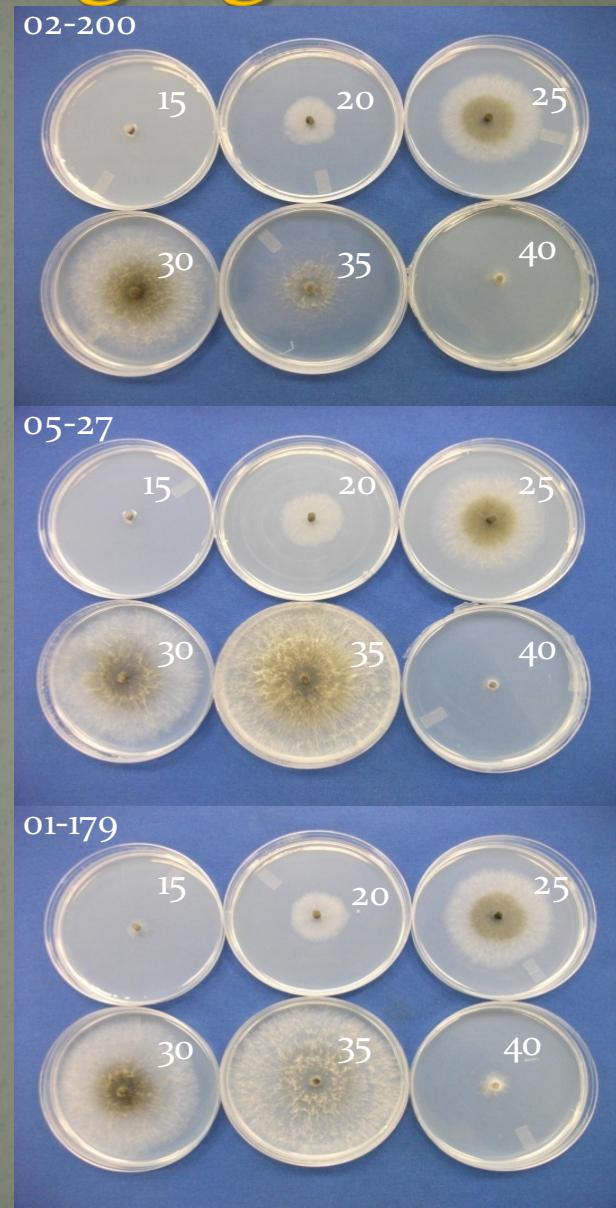

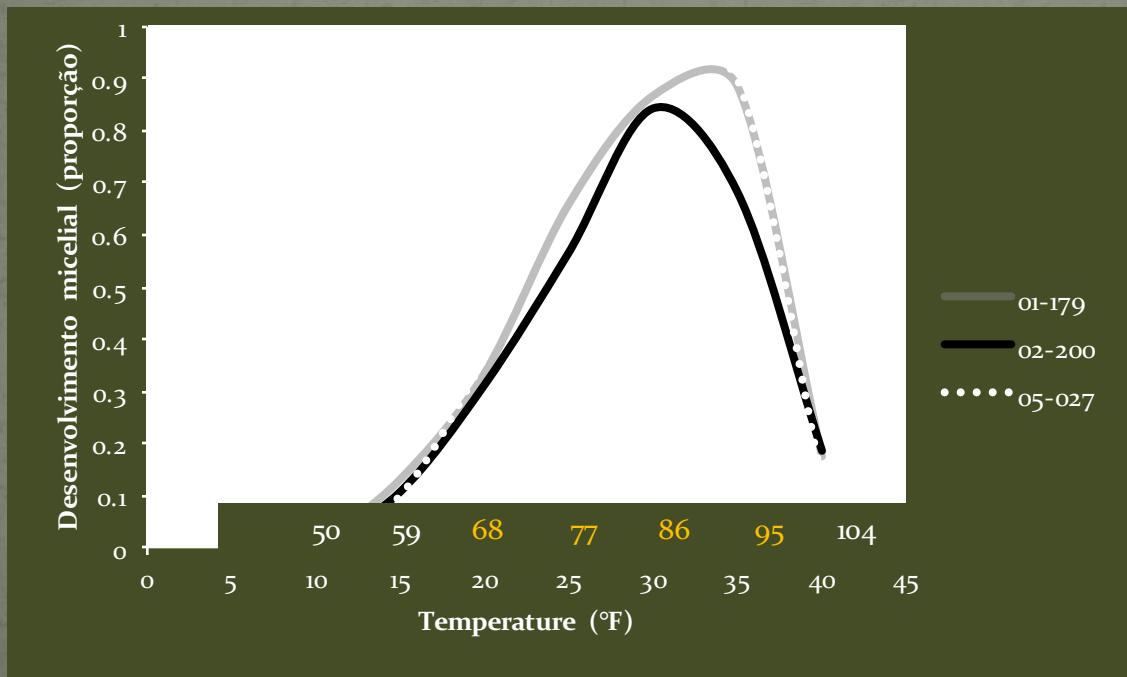

Charcoal rot

- ✓ FL in 2001; in CA in 2005 - coinciding with phase out of MB
- ✓ Patchy areas
- ✓ MB alternatives
- ✓ Usually observed early or late in the season – warmer temp

Charcoal Rot

- ✓ Survives in the soil as microsclerotia – viable for up to 3 years
- ✓ Up until this season, no indication of transplants infected from nursery
- ✓ Research trials in collaboration with Dr. Noling to evaluate MB alternative fumigants for control of *Macrophomina phaseolina*

Importance of fumigation distribution for Macrophomina control

Macrophomina trials summary

- ✓ Except for PicClor60 and Dazitol, most fumigants evaluated were able to effectively suppress Macrophomina inoculum in the soil *IF uniformly distributed in the beds*
- ✓ Treatments applied by drip usually performed poorly in the bed shoulders

Macrophomina management recommendation

- ✓ Integrated approach:
 - ✓ Crop destruction
 - ✓ Pre-plant fumigation
 - ✓ Cultivar selection
- ✓ FL Radiance, Winterstar and FL-127 are more tolerant to charcoal than Festival
